

Project description

The main purpose of this application will be to generate a list of gas stations in the immediate vicinity of the user. The user can choose the starting point from where the nearest gas station location will be generated, which can either be his/her current location or it can be user entered.

In both cases, a list of gas stations in its immediate vicinity should be generated, with the exact location, distance and time required to reach that location being given for each option (gas station).

When the customer selects a given gas station from the offered options, the route from the starting point to the destination (the desired gas station) will be generated.

The user can also filter the given gas station options based on some other user criteria such as: name of gas station, method of payment and distance.
