Project description

EateryFinder is a web application whose main purpose is to help the user to generate eateries located in its vicinity.

The user is first asked to allow access to his current location.

After that, using the current location of the user, 5 nearest restaurants or coffee bars near the user are generated.

For each of the generated restaurants, the user can choose to be shown detailed information or pictures of the given location.

The user also has the option to choose to be shown directions to reach the given location.
